# Basic System Interaction

## Exercise 1

- a) Write a function that takes a positive integer  $n$  as input and returns **true** if  $n$  is perfect and **false** if  $n$  is not perfect.

We could define a function to compute the aliquot sum of a positive integer  $n$ :

**5a**  $\langle \text{Compute the aliquot sum of a positive integer 5a} \rangle \equiv$   
 $\text{AliquotSum} := n \rightarrow \text{Sum}(\text{DivisorsInt}(n)) - n;$

$$s(n) \equiv \sigma(n) - n$$

Defines:

AliquotSum, used in chunk **5b**.

Then, using that definition, we could write a function to determine whether a positive integer  $n$  is perfect:

**5b**  $\langle \text{Determine whether a positive integer is perfect 5b} \rangle \equiv$   
 $\text{IsPerfect} := n \rightarrow n = \text{AliquotSum}(n);$

Uses AliquotSum **5a** and IsPerfect **7a**.

Conveniently, GAP ships with **Sigma**, which we can use instead.

$$\sigma(n) = \sum_{d|n} d$$

**5c**  $\langle \text{Determine whether a positive integer is perfect, using Sigma 5c} \rangle \equiv$  (7a)  
 $n \rightarrow \text{Sigma}(n) = 2*n$

$$\text{IsPerfect}(n) := \sigma(n) = 2n$$

- b) Use your function to find all perfect numbers less than 1000.

**5d**  $\langle \text{Find all perfect numbers less than 1000 5d} \rangle \equiv$  (7)  
 $\text{Filtered}([1..999], \text{IsPerfect});$

Uses IsPerfect **7a**.

$$\{n \in \mathbb{Z}^+ \mid 1 \leq n \leq 999, \text{IsPerfect}(n)\}$$

... which results in:

**5e**  $\langle \text{All perfect numbers less than 1000 5e} \rangle \equiv$  (7)  
 $[ 6, 28, 496 ]$

- c) Notice that all of the numbers you found have a certain form, namely  $2^n(2^{n+1}-1)$  for some integer  $n$ . Are all numbers of this form perfect?

No, using GAP we can show not all such numbers are perfect.

6a  $\langle \text{not all such numbers are perfect 6a} \rangle \equiv$   
`gap> ForAll( PositiveIntegers,  
> n  $\rightarrow$  IsPerfect( $2^n * (2^{(n+1)} - 1)$  ));  
false  
Uses IsPerfect 7a.`

- d) By experimenting in GAP, conjecture a necessary and sufficient condition for  $2^n(2^{n+1}-1)$  to be a perfect number.

In Euclid's formation rule (IX.36), he proved  $\frac{q(q+1)}{2}$  is an even perfect number where  $q$  is a prime of the form  $2^p - 1$  for prime  $p$ , a.k.a. a Mersenne prime.

6b  $\langle \text{Euclid's IX.36 6b} \rangle \equiv$   
`gap> MersennePrimes := Filtered( List( Primes{[1..50]}},  
p  $\rightarrow$   $2^p - 1$  ),  
IsPrime );  
[ 3, 7, 31, 127, 8191, 131071, 524287, 2147483647,  
2305843009213693951, 618970019642690137449562111,  
162259276829213363391578010288127,  
170141183460469231731687303715884105727 ]  
gap> ForAll( MersennePrimes, q  $\rightarrow$  IsPerfect( $q * (q + 1) / 2$  ));  
true  
Uses IsPerfect 7a.`

- e) Prove your conjecture is correct.

Prove it

### Code

For **IsPerfect**, use the following filter, since we only care about integers, or more specifically, positive integers.

6c  $\langle \text{Filter for positive integers 6c} \rangle \equiv$  (6d 7a)  
`IsInt and IsPosInt`

6d  $\langle \text{gap/PerfectNumbers.gd 6d} \rangle \equiv$   

```
#! @Chapter PerfectNumbers

#! @Section The IsPerfect() Operation

#! @Description
#! Determine whether a positive <A>int</A> is perfect.
#! @Arguments int
DeclareOperation( "IsPerfect",
  [ <Filter for positive integers 6c> ] );
```

Uses IsPerfect 7a.

7a `<gap/PerfectNumbers.gi 7a>≡`  
`#! @Chapter PerfectNumbers`  
  
`#! @Section The IsPerfect() Operation`  
  
`InstallMethod( IsPerfect,`  
 `"for a positive integer",`  
 `[ <Filter for positive integers 6c> ],`  
 `<Determine whether a positive integer is perfect, using Sigma 5c> );`  
  
`#! @BeginExample`  
`<Find all perfect numbers less than 1000 5d>`  
`#! <All perfect numbers less than 1000 5e>`  
`#! @EndExample`  
 Defines:  
 IsPerfect, used in chunks 5 and 6.

### Tests

Describe this

7b `<tst/PerfectNumbers.tst 7b>≡`  
`gap> START_TEST("AAIG package: PerfectNumbers.tst");`  
  
`gap> <Find all perfect numbers less than 1000 5d>`  
`<All perfect numbers less than 1000 5e>`  
  
`gap> STOP_TEST( "AAIG package: PerfectNumbers.tst", 10000 );`  
 To test the package, create a file `tst/testall.g`.

7c `<tst/testall.g 7c>≡`  
`<Load the package 7d>`  
  
`<Call TestDirectory 8a>`  
  
`<Force quit GAP 8b>`

First load the package:

7d `<Load the package 7d>≡` (7c)  
`LoadPackage( "AAIG" );`

Then get the list of directory objects for the `tst` directory of the AAIG package:

7e `<The list of directory objects 7e>≡` (8a)  
`DirectoriesPackageLibrary("AAIG", "tst"),`

... and call `TestDirectory` on it, with the following options:

7f `<TestDirectory options record 7f>≡` (8a)  
`rec( exitGAP := true,`  
 `testOptions := rec(compareFunction := "uptowhitespace") )`

8a     $\langle \text{Call } \text{TestDirectory } 8a \rangle \equiv$  (7c)  
       `TestDirectory(  $\langle \text{The list of directory objects } 7e \rangle$`   
                        $\langle \text{TestDirectory options record } 7f \rangle$  );

Finally, force quit GAP, in case it hasn't exited already:

8b     $\langle \text{Force quit } \text{GAP } 8b \rangle \equiv$  (7c)  
       `FORCE_QUIT_GAP(1);`

## Miscellaneous

```
9  <PackageInfo.g 9>≡
    SetPackageInfo( rec(
